Ibanez Instruments are unique in the simplicity and versatility of our switching systems. Each model was designed to allow the maximum amount of useful pickup positions with the simplest operations.

- **High Pass On/Off Sw.**
STRING GAUGES

All guitars are set up at the factory with light gauge 009”-042” strings (7-string 009”-054”). Different gauges of strings can result in the need for string height, neck curvature, tremolo spring and intonation readjustments.

ADJUSTMENT

Ibanez guitars feature four styles of locking tremolos. To identify which tremolo is used on your guitar, locate the logo stamped either on the bridge plate or the bridge tremolo block.

*Both Lo-Pro Edge and Edge tremolos have the “Edge” logo on the tremolo blocks.

*Adjustment of the 7-string tremolo is the same as the corresponding 6-string tremolo.

**STRING HEIGHT, tighten the Stud lock screws (C) before tightening the Pivot studs (B). After adjusting the Pivot studs (B) are locked internally by the Stud lock screws (C).**

In the case of Edge and Lo-Pro Edge tremolos, the clock wise raises the tremolo. Clockwise lowers the tremolo and counter clockwise lowers the tremolo.

The height adjustment of the tremolo can be raised or lowered by adjusting the pivot studs (B) that the tremolo mounts on. These are located at either side of the front of the bridge. Clockwise lowers the tremolo and counter clockwise raises the tremolo.

In the case of Edge and Lo-Pro Edge tremolos, the Pivot studs (B) are locked internally by the Stud lock screws (C). Always loosen the Stud lock screws (C) before tightening the Pivot studs (B). After adjusting the string height, tighten the Stud lock screws (C).

**FINE TUNING**

After locking the top lock, fine tuning the instrument can be done by turning the fine tuning screws (A).

*To allow maximum fine tuning adjustment, it is recommended that the fine tuners be set to the middle position before locking the nut.

**INTONATION**

Loosen the Pressure pad screw (D) on the locking nut and loosen the string to be adjusted. Loosen the Saddle lock screws (E) on the saddle to be adjusted and adjust the saddle forward or backward. Tighten the Saddle lock screw (E) and tune the string. After rechecking the intonation, tighten the Pressure pad screw (D).

On the base plate there are two holes for each Saddle lock screw (C). These allow the user to change string gauges while allowing the maximum saddle movement. If the intonation cannot be adjusted because the saddle needs to be set back further, remove the intonation screw and insert it into the hole located further back on the bridge plate.

**REPLACING THE STRINGS**

In the case of locking tremolos, replace the strings one by one. Removing all the old strings at once will release the tension on the tremolo and change the tremolo angle “up-pull.” Loosen the Pressure pad screw (D) on the locking nut and loosen the string to be replaced. Loosen the String stopper screw (F) and remove the string from the saddle. Cut off the ball end of new string as shown on the illustration and insert the cut side of new string between the saddle and the String holder block. Tighten the String holder block. Tighten the String holder hook (G). Thread new string through the String holder hook (G) and tune it. After checking the intonation, tighten the Pressure pad screw (D) on the locking nut.

In the case of TRS505 tremolo, replace the strings one by one. Removing all the old strings at once will release the tension on the tremolo and change the tremolo angle “up-pull.”

Loosen the Pressure pad screw (D) on the locking nut and loosen the string to be replaced. Remove the string through the String holder hook (G). Thread new string through the String holder hook (G) and tune it. After checking the intonation, tighten the Pressure pad screw (D) on the locking nut.

TRSS05

In the case of TRSS05 tremolo, replace the strings one by one. Removing all the old strings at once will release the tension on the tremolo and change the tremolo angle “up-pull.”

Loosen the Pressure pad screw (D) on the locking nut and loosen the string to be replaced. Remove the string through the String holder hook (G). Thread new string through the String holder hook (G) and tune it. After checking the intonation, tighten the Pressure pad screw (D) on the locking nut.

**TREMOLO SPRING**

The tremolo springs adjust the tremolo angle by tightening or loosening the tremolo tension. To adjust tremolo angle, locate the adjustment screws (H) on the tremolo cavity. The tremolo system when in tune should sit parallel to the surface of the guitar.

If the tremolo system is not sitting parallel to the surface of the guitar, remove the tremolo cavity cover plate and tighten the Tremolo tension adjustment screws (H) if the tremolo is forward dumped.

Loosen the screws (H) if the tremolo is up-pulled. Retune the strings to the proper pitch and check the angle. Edge and Lo-Pro Edge tremolos have the Block Lock System to lock the tremolo springs on the tremolo block. Remove the Block Lock when replacing the springs. Choose the number and placement of the tremolo springs according to the string gauge and the tremolo angle as follows.
